Jan wants to compute in R the probability of obtaining at least one 6 when rolling a fair dice 4 times. He should use the command

- ☐ a. `dbinom(0,4,1/6)`
- ☐ b. `qbinom(0,4,1/6)`
- ☐ c. `1-pbinom(0,4,1/6)`
- ☐ d. `rbinom(0,4,1/6)`

c)

The chance of rolling a 6 (the chance of having a success) is $1/6$. The Binomial distribution looks at the number of successes at given probability p of having a success in one try.

a) gives us the of having no successes in 4 rolls

```
> (5/6)^4  
[1] 0.4822531  
> dbinom(0,4,1/6)  
[1] 0.4822531
```

b) returns x , where likelihood of having x or less number of successes is 0.

c) 1-probability of having no successes, so it returns probability of having at least one success

d) returns vector of length 0 with number of successes in 4 random rolls.

Student's one-sample 99%-confidence interval is evaluated on n data and it overlaps a claimed parameter μ_0 . Let q be the 99.5%-quantile of the $t(n-1)$ -distribution. It holds that

- ☐ a. the distance of the mean of the data and μ_0 is larger than q times the standard error of the mean
- ☐ b. the expectation of the sum of two $t(n+1)$ -distributed random variables equals the sum of their expectations
- ☐ c. the null hypothesis $H_0: \mu = \mu_0$ of Student's (two-sided one-sample) t -test is not rejected at 5% significance level
- ☐ d. the distance of the mean of the data and μ_0 is smaller than $q/2$ times the standard error of the mean

b)

The t -distribution is symmetric.

Let X_1, X_2, \dots, X_{36} be an i.i.d. sample from a population with population mean $\mu = 5$ and population variance $\sigma^2 = 4$ and let $S = X_1 + X_2 + \dots + X_{36}$. Approximate the probability $P(S \notin [168, 192])$ using the Central limit theorem.

- ☐ a. 68%
- ☐ b. 45%
- ☐ c. 78%
- ☐ d. 32%

d)

$$\begin{aligned}
 P(X_n \cdot n \notin [168, 192]) &= P(X_n \cdot n < 168) + P(X_n \cdot n > 192) = \\
 P(X_n \cdot n < 168) + 1 - P(X_n \cdot n < 192) &= P(X_n \cdot n - n \cdot \mu < -12) + 1 - \\
 P(X_n \cdot n - n \cdot \mu < 12) &= P(X_n - \mu < -\frac{1}{3}) + 1 - P(X_n - \mu < \frac{1}{3}) = \\
 P\left(\frac{X_n - \mu}{\sigma} < -1\right) + 1 - P\left(\frac{X_n - \mu}{\sigma} < 1\right) &= \\
 1 + \Phi(-1) - \Phi(1)
 \end{aligned}$$

Let A and B be two independent events such that $P(A|B)=0.3$ and $P(B|A)=0.6$. Compute the probability $P(A^c \cap B)$.

- ☐ a. 0.56
- ☐ b. 0.12
- ☒ c. 0.42
- ☐ d. 0.18

[Meine Auswahl widerrufen](#)

c)

$$\begin{aligned}
 P(A|B) &= \frac{P(A)P(B)}{P(B)} = 0,3 \quad \Rightarrow P(A) = 0,3 \\
 P(B|A) &= \frac{P(B)P(A)}{P(A)} = 0,6 \quad \Rightarrow P(B) = 0,6 \\
 P(A^c \cap B) &= P(A^c)P(B) = 0,7 \cdot 0,6 = 0,42
 \end{aligned}$$

Frage 10

Frage markieren

For the P -value of a statistical test of significance level α it always holds true

- ☐ a. $P \leq \alpha/2$, if the null hypothesis was rejected
- ☐ b. P always lies in the complement of $(-\infty, -1)$ regarding R
- ☐ c. $P \leq \alpha$, if the null hypothesis was not rejected
- ☐ d. $P > 2\alpha$, if the null hypothesis was rejected

b)

The p value is a probability so it must be equal or greater than 0

The Null-hypothesis is rejected, when p-value < alpha, so c & d are false and a is not always true

Frage 11

Frage markieren

For a statistical test of significance level α it holds

- ☐ a. the rejection area depends on $1 - \alpha$
- ☐ b. rejection at level α implies rejection at level $\alpha/2$
- ☐ c. the rejection area does not depend on the distribution of the test statistic under the null hypothesis
- ☐ d. the rejection area shrinks when α is increased

a)

Frage 12

Frage markieren

Two features of a novel operating system are compared using a two-sample t -test. The statistics for the first feature are $\bar{x} = 15$, $s_x^2 = 55$ and $n_x = 5$ and those for the second feature are $\bar{y} = 21$, $s_y = 10$ and $n_y = 4$. The rejection region is given through $R = (-\infty, -q] \cup [q, \infty)$. Then it holds

- ☐ a. we reject for $q = 2.5$ but not for $q = 1.5$
- ☐ b. we reject for both $q = 2.5$ and $q = 1.5$
- ☐ c. we do neither reject for $q = 2.5$ nor for $q = 1.5$
- ☐ d. we do not reject for $q = 2.5$ but for $q = 1.5$

d)

$$\begin{aligned}\bar{x} &= 15 & \bar{y} &= 21 \\ s_x^2 &= 55 & s_y &= 10 \\ n_x &= 5 & n_y &= 4\end{aligned}$$

$$s_p = \sqrt{\frac{4 \cdot 55 + 3 \cdot 100}{7}} \approx 8,6$$

$$T = \frac{15 - 21}{8,6 \cdot \sqrt{0,45}} = -1 \quad t = 2,262$$

$$\alpha = 0,05$$

~~$P(T > 1) =$~~

\Rightarrow Acceptance region $[-2,262, 2,262]$

Frage 13

Frage
markieren

In the context of a statistical test the null hypothesis was not rejected. Which interpretation is reasonable?

- ☐ a. the data are hardly compatible with the null hypothesis
- ☐ b. the null hypothesis is not compatible with an alternative hypothesis
- ☐ c. the null hypothesis was not significant
- ☐ d. the data barely give us a reason to doubt the null hypothesis

d)

Frage 14

Bisher nicht
beantwortet

Erreichbare

Frage
markieren

In the situation of a right-sided one-sample t -test we find $\bar{x} = -12$, $s = 21$ and $n = 49$. For a given significance level we find the rejection region $R = [2.2, \infty)$. Then for the null hypothesis $H_0: \mu = -3$ it holds

- ☐ a. we do not reject H_0 , and we would also not reject for any smaller choice of the significance level
- ☐ b. we reject H_0 , and we would also reject for any larger significance level
- ☐ c. we reject H_0 , and we would also reject for any smaller significance level
- ☐ d. we do not reject H_0 , but we would reject if only the significance level was chosen small enough

b)

$$\mu > \mu_0$$

$$\bar{x} = -12, s = 21, n = 49$$

$$R = [2, 2, \infty)$$

$$H_0: \mu_0 = -3 \quad H_1: \mu > \mu_0$$

$$T = \frac{(\bar{X}_n - \mu_0) \sqrt{n}}{s} = \frac{9 \cdot 7}{21} = 3$$

$$\Rightarrow T > 2,2 \Rightarrow \text{reject}$$

looking for t so that $P(X > t) = \alpha$ \downarrow we know for given α $t = 2,2$

if $\alpha^* < \alpha \Rightarrow t^* > t$

if $\alpha^* > \alpha \Rightarrow t^* < t \Rightarrow H_0$ would also be rejected for greater significance level

Frage 15

Frage markieren

Suppose box A contains 4 red and 5 blue coins and box B contains 6 red and 3 blue coins. A coin is chosen at random from box A and placed in box B. Finally, a coin is chosen at random from among those that are now in box B. What is the probability a red coin was transferred from box A to box B given that the coin chosen from box B is blue?

- ☐ a. 3/8
- ☐ b. 5/8
- ☐ c. 16/45
- ☐ d. 2/9

a)

$$\frac{4}{9} \cdot \frac{3}{10}$$

$$P(R_B | B_B)$$

$$P(\text{Red transferred}) = \frac{4}{9}$$

$$P(\text{Blue transferred}) = \frac{5}{9}$$

$$P(\text{picking red}) = \frac{4}{9} \cdot \frac{7}{10} + \frac{5}{9} \cdot \frac{6}{10}$$

$$P(\text{picking blue}) = \frac{4}{9} \cdot \frac{3}{10} + \frac{5}{9} \cdot \frac{4}{10}$$

$$\frac{P(\text{red transferred \& blue picked})}{P(\text{blue picked})} = \frac{\frac{4}{9} \cdot \frac{3}{10}}{\frac{32}{90}} = \frac{12}{32}$$

$$= \frac{6}{16} = \frac{3}{8}$$
